

Water of Crystallisation

Complete Study Card · Class 10 Chemistry

What is Water of Crystallisation?

Water of crystallisation is the **fixed number of water molecules** associated with one formula unit of a crystalline salt. These molecules are part of the crystal structure and give the salt its colour and shape.

Salts with water of crystallisation are **hydrated salts**. On strong heating they become **anhydrous** (waterless), often changing colour.

Tip: The dot '.' in $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ means 'associated with'. The number before H_2O = water molecules per formula unit.

Hydrated Salts — Reference Table

Common Name	Chemical Name	Formula	Water Molecules	Colour
Blue Vitriol (Bluestone)	Copper Sulphate pentahydrate	$\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$	5	Blue
Washing Soda	Sodium Carbonate decahydrate	$\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$	10	Colourless / White
Gypsum	Calcium Sulphate dihydrate	$\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$	2	White
Plaster of Paris (POP)	Calcium Sulphate hemihydrate	$\text{CaSO}_4 \cdot \frac{1}{2} \text{H}_2\text{O}$	1/2	White powder
Green Vitriol (Copperas)	Ferrous Sulphate heptahydrate	$\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$	7	Light Green
White Vitriol	Zinc Sulphate heptahydrate	$\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$	7	Colourless
Epsom Salt	Magnesium Sulphate heptahydrate	$\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$	7	Colourless
Borax	Sodium Tetraborate decahydrate	$\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$	10	White
Alum	Potassium Alum dodecahydrate	$\text{KAl}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$	12	Colourless

What Happens on Heating Hydrated Salts?

Hydrated Salt	Reaction on Heating	Observation
Blue Vitriol $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$	$\text{CuSO}_4 \cdot 5\text{H}_2\text{O} \xrightarrow{\text{heat}} \text{CuSO}_4 + 5\text{H}_2\text{O}$	Blue → White (Reversible — add water to restore blue)
Green Vitriol $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$	$2\text{FeSO}_4 \cdot 7\text{H}_2\text{O} \xrightarrow{\text{heat}} \text{Fe}_2\text{O}_3 + \text{SO}_2 + \text{SO}_3 + 14\text{H}_2\text{O}$	Green → Reddish-brown (Irreversible)
Washing Soda $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$	$\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O} \xrightarrow{\text{heat}} \text{Na}_2\text{CO}_3 + 10\text{H}_2\text{O}$	White crystals → White powder

Hydrated Salt	Reaction on Heating	Observation
Gypsum $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$	$\text{CaSO}_4 \cdot 2\text{H}_2\text{O} \xrightarrow{(120\text{ C})} \text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O} + \frac{3}{2}\text{H}_2\text{O}$	Gypsum → Plaster of Paris

Gypsum vs Plaster of Paris — Key Differences

Property	Gypsum	Plaster of Paris (POP)
Chemical name	Calcium Sulphate dihydrate	Calcium Sulphate hemihydrate
Formula	$\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$	$\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$
Water molecules	2 per formula unit	$\frac{1}{2}$ per formula unit
Obtained by	Found naturally / POP + water	Heating Gypsum at 120 C
Uses	Making POP, fertilisers	Casts, statues, bone fracture support
Sets hard?	Already hard crystal	Sets hard when water is added (Exothermic)

Setting Reaction of Plaster of Paris

When water is added to POP it rehydrates and sets hard as Gypsum (exothermic):

(Plaster of Paris → Gypsum — hard solid)

Tip: Board Tips: • Blue vitriol test: Add water to white CuSO_4 → turns blue again (reversible test). • FeSO_4 heating is irreversible (forms Fe_2O_3). • POP must NOT be stored in moist places — it absorbs moisture and sets prematurely. • The $\frac{1}{2}$ water in POP means 1 water molecule is shared between 2 formula units.
